

PRESS RELEASE · FOR IMMEDIATE RELEASE

India builds अचूक — a new programming language where AI-written code *can't* be fake

LambdaQ Labs releases Achuk: an open-source AI-first language that ships its own model and out-scores Python and Go on a reproducible benchmark — built for under \$2.

Pune / Maharashtra, India — 6 July 2026. LambdaQ Labs today released **Achuk** (अचूक, Marathi for “infallible”), an open-source programming language designed for the age of AI-written code.

Every developer using AI to write code has hit the same wall: the AI confidently produces code that calls a function which does not exist. It looks perfect, then it breaks. The industry's answer has been “write better prompts.” LambdaQ Labs built a different answer — a language in which such mistakes are **structurally impossible**.

In Achuk, every line the AI writes is constrained to the project's real symbols, and verified by the actual compiler *before the developer ever sees it*. If the code is wrong, it is rejected — never handed over as a silent bug. And Achuk ships with its own fine-tuned AI model built in: one command installs it, with no API keys and no cloud, running on any laptop.

94%

CORRECT IN ACHUK

56%

SAME MODEL, PYTHON

7%

SAME MODEL, GO

38 → 0

HALLUCINATED CALLS

On the project's public, execution-graded benchmark, the same AI model writes **94% correct code in Achuk** versus 56% in Python and 7% in Go — and invented function calls dropped from 38 per run to zero. Every result is reproducible from the open-source repository.

The entire language, model, package registry and playground were built in a handful of days for **under \$2** of cloud compute — and released fully open-source.

“We didn’t want a language only humans could trust, or only machines could write. Achuk is built so both can — the guarantees live in the language itself, not in hoping the model gets it right. That it carries a Marathi name for infallible is exactly the point.”

— Ninad, Founder, LambdaQ Labs

Made in India, for the world

Achuk is a fully open-source project from LambdaQ Labs, a deep-tech company building frontier AI from India. It joins a small global frontier of “AI-first” languages — and is among the first to combine grammar-constrained generation, real compiler verification, and a bundled model into a single one-command install.
